

One message. Two paths.

Ask in chat. RivalPulse chooses the smallest safe workflow, then shows what it did and what the evidence can actually support.

1

You send a message in Agent chat

Example: "Add ISAT to my watchlist" or "What changed this week?"

Intent routing · Can this be answered without external evidence?

PATH A · INSTANT

Workspace command

Add/remove a competitor, rename or show the watchlist, or ask for help.

- Rules check valid companies and watchlist limits.
- The backend saves watchlist changes.

Result: immediate chat reply. No research run, Qwen planning, or provider credits.

PATH B · EVIDENCE-BACKED

Research question

The backend freezes the watchlist and prior state, then queues a tracked investigation.

- **Qwen** can propose approved tools when live planning is enabled.
- Code enforces company scope, required tools, budgets and deadlines.
- Bad plan? One repair attempt, then a visibly marked safe plan.

Result: live progress in chat while evidence is collected.

Inside a research run

FINANCIAL QUESTION

Annual figures → cited brief

Collect revenue and earnings by reporting year. Compare only compatible facts. Qwen may add a short, claim-linked interpretation.

Annual statements **cannot prove what changed this week.**

RECENT ACTIVITY QUESTION

Official pages → change check

Collect approved public pages plus financial context. Compare verified observations with the stored baseline; label new, updated, baseline or unchanged.

Failed pages **do not mean "no change."**

Backend gate → publish

Verify source pointers, citations and claim links; reject invented numbers or unsupported findings. Store snapshots, run results and conversation history in PostgreSQL. Optional Gmail alerts are for newly published important changes only.

Complete

Supported answer and coverage available.

Limited coverage

Some sources or claims could not be verified.

Stopped

No unsupported answer substituted; retry if appropriate.

Data sources: Sectors v2 is the sole live financial provider. Synthetic replay is for automated tests only.

Division of work: Qwen suggests and interprets. Backend code owns access, costs, numbers, comparisons and citations.
